Introduction

Infoblox vNIOS for Oracle Cloud Infrastructure (OCI) is a virtual appliance designed for deployment as a Virtual Machine (VM) instance on OCI. Infoblox vNIOS for OCI enables you to deploy robust, manageable and cost effective Infoblox appliances in the Oracle Cloud.

Infoblox NIOS is the underlying software running on Infoblox appliances and virtual appliances which provide core network services and a framework for integrating all the components of the modular Infoblox solution. It provides integrated, secure, and easy-to-manage DNS (Domain Name System), DHCP (Dynamic Host Configuration Protocol), IPAM (IP address management) and other services.

Infoblox vNIOS for OCI supports deployment of a Cloud Platform (CP) appliance which can be joined to your existing on-premises Infoblox Grid. The CP appliance allows you to extend DNS and IPAM services into your OCI Virtual Cloud Networks (VCN). The vNIOS appliance can be configured as a primary DNS server for your OCI VCNs to gain advantages of centralized management, security, and other features of Infoblox DNS. You can also use Infoblox Cloud Network Automation with vNIOS for OCI to enable automated provisioning of apps and services in OCI.

Prerequisites

The following are prerequisites to deploying and managing an Infoblox vNIOS for OCI appliance:

- Valid OCI account.
- Permissions on OCI to create VCNs, VMs, and related resources.
- On-premises Infoblox Grid which the vNIOS for OCI appliance will connect to.
- Understanding of basic networking concepts and tools, including public and private IP addressing, DNS, Secure Shell (SSH), and command line/terminal applications.

Workflow

The following are the basic steps to deploy and configure an Infoblox vNIOS for OCI instance (steps 1 and 2 may be skipped if deploying into an existing VCN):

1. Deploy OCI VCN and subnets.
2. Configure VCN security, gateway, and routes.
3. Create Infoblox vNIOS for OCI instance.
4. Join vNIOS instance to Grid.

OCI Objects and Terms

Before deploying Infoblox vNIOS for OCI, an administrator should understand some common terms and resources available in OCI which relate to the deployment of vNIOS. The following are some of these common terms and resources:

- **Compartment:** A container used for grouping related resources. Compartments can be used to organize and manage access to resources.
- **Console Connection:** OCI Console Connections provide virtual serial or VNC consoles for connecting to and troubleshooting your compute instances.
- **FastConnect:** OCI FastConnect is used to establish private connections between OCI VCNs and on-premises networks.

- **Object Storage:** OCI Object storage provides storage for unstructured data of any type. Objects are organized into logical storage containers, called Buckets.
- **Security List:** Security Lists serve as a virtual firewall in OCI VCNs. Ingress and Egress rules are added to security lists to allow communication outside of VCNs.
- **VCN:** Virtual Cloud Networks are private virtual networks deployed in an OCI region. Within VCNs, you can configure subnets, firewall rules, and gateways for external communication.
- **VNIC:** Virtual Network Interface Cards are used to connect instances to VCNs, providing all network communication.

Infoblox vNIOS for OCI Use Cases

Extending your Infoblox Grid into OCI with vNIOS appliances can provide solutions for many hybrid cloud infrastructure requirements and issues. The following are some of the common use cases:

DNS and RPZ for Public Cloud

A vNIOS appliance can be used as the primary DNS server in OCI VCNs. This allows you to extend your enterprise DNS and RPZ services into the public cloud. Clients running on OCI, attached to your VCNs, are able to use the same consolidated and secure DNS service as clients on-premises and in your private cloud environments. vNIOS appliances running the DNS service can be deployed in shared services virtual cloud networks and used for DNS resolution across other virtual cloud networks via peering relationships.

IPAM and DNS Automation for Public Cloud

Infoblox Cloud Platform appliances, such as the CP-V2205 available for OCI, process API requests for automated provisioning of apps and services in your cloud environments. Since API requests are processed locally on the CP appliance, these features are sustained even if there is a network outage between your on-premises Grid Master and the vNIOS for OCI appliance. Additionally, supported Infoblox plugins for tools such as Ansible and Terraform can be used to integrate the CP appliances running on OCI into your DevOps automation workflows.

DHCP Service for On-Premises Clients

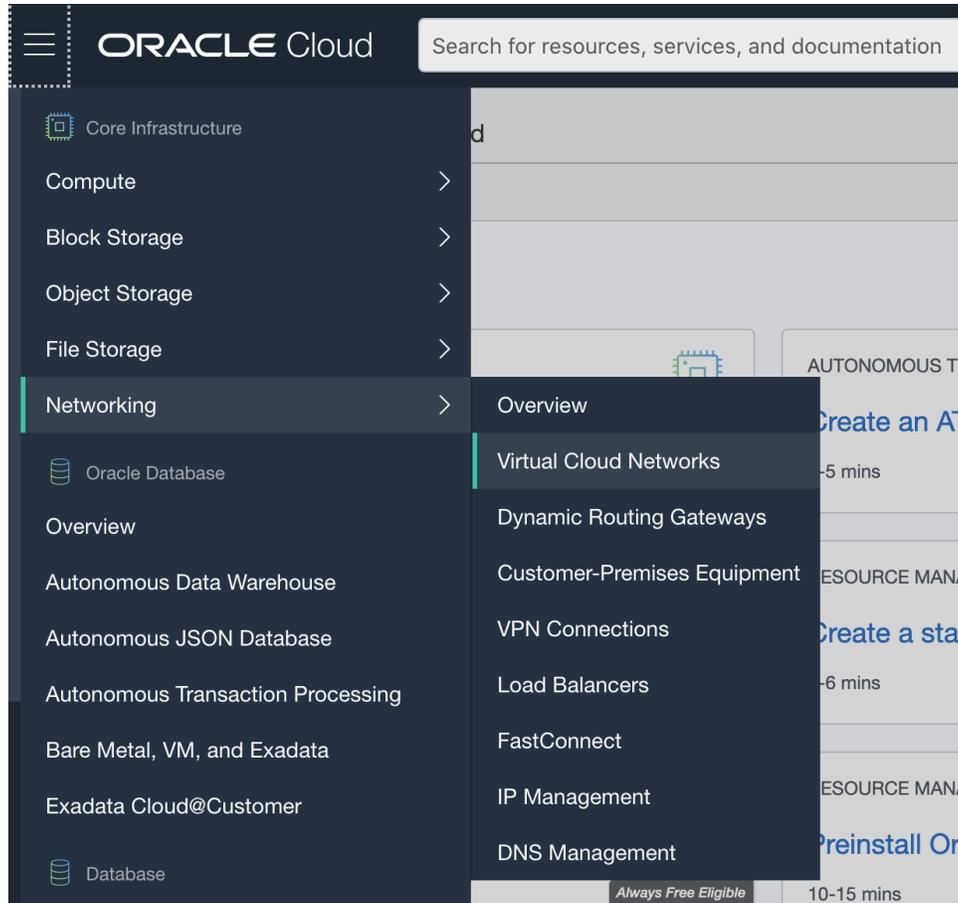

A vNIOS appliance running on OCI can provide DHCP service for your on-premises clients. This DHCP appliance can serve as a primary DHCP server for your on-premises networks. Using a vNIOS appliance running on OCI for DHCP requires using DHCP Relay or IP Helper on your router or layer 3 switch to send DHCP traffic from your on-premises network to your OCI VCN.

Deploy OCI VCN

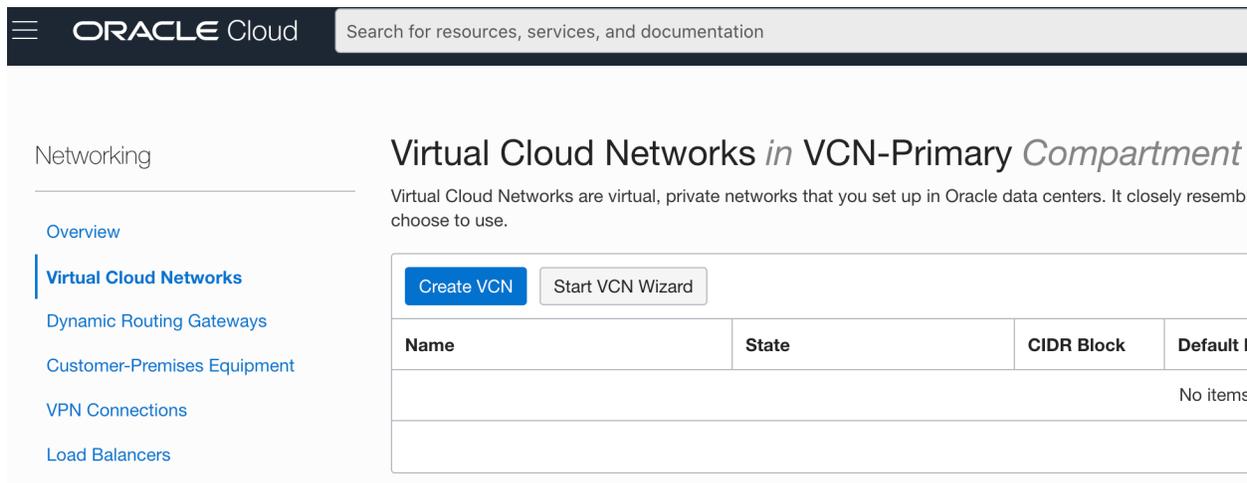

Prior to deploying a vNIOS for OCI instance, you will need a VCN in the desired region. If you are deploying vNIOS into an existing VCN, ensure you have two available subnets and security list rules will allow the minimum necessary for Infoblox Grid communication, then skip ahead to the [Deploy vNIOS Instance in OCI](#) section.

Create VCN

1. Login to the Oracle Cloud Infrastructure Console.
2. In the Service menu in the upper left corner, hover on **Networking** to expand.
3. Select **Virtual Cloud Networks**.

4. Use the Compartment dropdown to select the desired compartment.
5. Click on **Create VCN**.

6. In the Create a Virtual Cloud Network pane, enter a name for your VCN.
7. If needed, use the dropdown to select the compartment where you will create the VCN.
8. Enter a CIDR Block for your VCN, for example **192.168.1.0/24**.
9. Click on **Create VCN**.

10. When the VCN has been successfully created, you will be taken to the Virtual Cloud Network Details page.

Configure Security List

Next, we'll create a Security List to control ingress and egress of Grid and services traffic for the vNIOS instance.

1. From the VCN Details page, select **Security Lists** under resources.
2. Click on **Create Security List**.

Note: You could instead add rules to the Default Security List for the VCN. Creating a new list allows you to be more selective about which subnets it is applied to.

DESCRIPTION OPTIONAL

Infoblox Grid Traffic

Maximum 255 characters

+ Another Ingress Rule

11. Repeat Steps 5-10 for the protocols and ports you plan to use from the table below. At a minimum, you will need rules for UDP 1194 and 2114 to allow for Infoblox Grid traffic.

Type	Protocol	Port Range	Description
SSH	TCP	22	SSH for Administration
DNS (UDP)	UDP	53	UDP DNS
DNS (TCP)	TCP	53	TCP DNS
HTTPS	TCP	443	HTTPS for Grid Manager
Custom UDP Rule	UDP	1194	NIOS Grid Traffic
Custom UDP Rule	UDP	2114	NIOS Grid Traffic
Custom UDP Rule	UDP	67-68	DHCP

12. Once you have entered all necessary Ingress rules, click on **+ Another Egress Rule**.

The screenshot shows a section titled "Allow Rules for Egress" with a button labeled "+ Another Egress Rule". Above it, there is a section for Ingress rules with a button labeled "+ Another Ingress Rule".

13. Under Egress Rule 1, leave Source Type as **CIDR**.

14. Enter a Destination CIDR. Example, **0.0.0.0/0**.

15. Use the IP Protocols dropdown to select **All Protocols**.

Note: For this guide, we use 0.0.0.0/0 and All Protocols to allow all egress traffic. You can optionally add more restrictive rules to limit egress traffic.

16. Optionally, enter a Description.

The screenshot shows the "Allow Rules for Egress" dialog box for "Egress Rule 1". It includes a "STATELESS" checkbox, "DESTINATION TYPE" dropdown set to "CIDR", "DESTINATION CIDR" text box containing "0.0.0.0/0", and "IP PROTOCOL" dropdown set to "All Protocols". A description field contains "Allow - All - Egress". A note below the CIDR field states: "Specified IP addresses: 0.0.0.0-255.255.255.255 (4,294,967,296 IP addresses)". A "+ Another Egress Rule" button is at the bottom right.

17. Once you have finished adding all Ingress and Egress rules, Click on **Create Security List**.

The screenshot shows the "Create Security List" dialog box. It includes a "+ Another Egress Rule" button at the top. Below it is a text box explaining tagging: "Tagging is a metadata system that allows you to organize and track resources within your tenancy. Tags are composed of keys and values that can be attached to resources." A link "Learn more about tagging" is provided. Below the text is a table for adding tags with columns "TAG NAMESPACE", "TAG KEY", and "VALUE". The "TAG NAMESPACE" dropdown is set to "None (add a free-form tag)". A "+ Additional Tag" button is at the bottom right. At the bottom left are "Create Security List" and "Cancel" buttons.

Create Subnets

Infoblox vNIOS for OCI instances require two subnets, one for the LAN1 interface and one for the MGMT interface.

1. From the VCN Details page, select **Subnets** under resources.
2. Click on **Create Subnet**.

Deploy vNIOS Instance in OCI

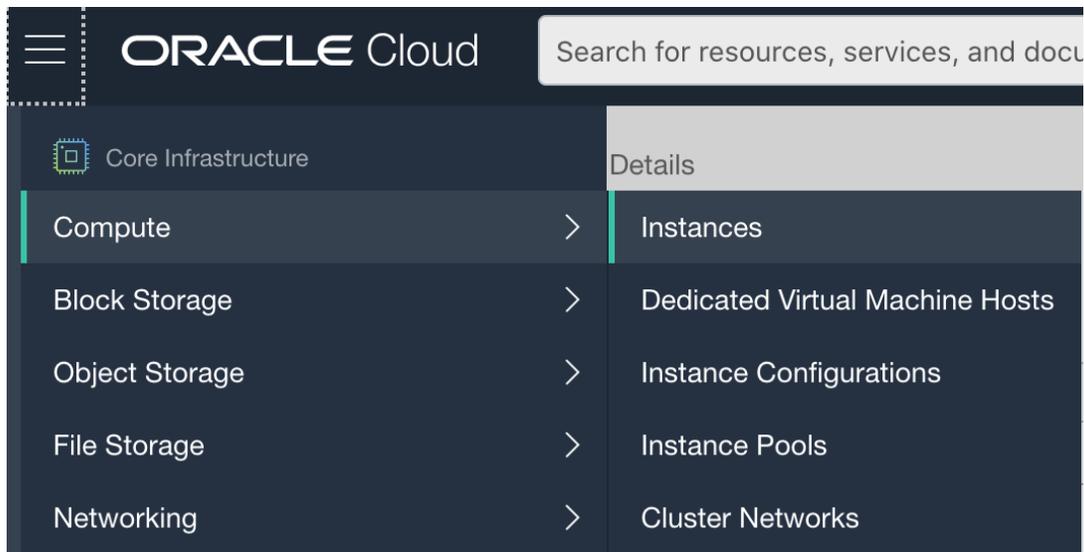

Now that you have a VCN, subnets, security list, and routes configured, you can deploy a vNIOS instance in OCI. Infoblox vNIOS for OCI can be found in the Oracle Cloud Marketplace at https://cloudmarketplace.oracle.com/marketplace/app/Infoblox_NIOS or selected from partner images during instance deployment. To deploy from the Oracle Cloud Marketplace, use the Get App button to begin deploying into your OCI tenancy.

Create Instance

With the VCN configured, you are ready to deploy your Infoblox vNIOS for OCI instance. If you are deploying this image from the Oracle Cloud Marketplace, skip to Step 6 of the [Select Image and Shape](#) section to continue deployment.

1. In the OCI Console, open the Services menu.
2. Hover on **Compute** to expand.
3. Select **Instances**.

4. Click on **Create Instance**.

Instances *in* vNIOS-Demo *Compartment*

The [Compute service](#) helps you provision VMs and bare metal instances to meet your instances. The image that you use to launch an instance determines its operating system.

9. Scroll down to the Add SSH keys section.

10. Choose from the available options.

*Note: While SSH keys are not required here, you will need keys later to connect to the instance virtual console. To generate keys now, select **Generate SSH key pair**. Click on **Save Private Key** and **Save Public Key** to download these keys.*

11. Leave Configure boot volume settings at their default.

Add SSH keys

Linux-based instances use an [SSH key pair](#) instead of a password to authenticate remote users. Generate a key pair or upload your own public key now. When you [connect to the instance](#), you will provide the associated private key.

Generate SSH key pair Choose public key files Paste public keys No SSH keys

Download the private key so that you can connect to the instance using SSH. It will not be shown again.

[↓ Save Private Key](#) [↓ Save Public Key](#)

12. Under Boot volume, check the box to **Specify a custom boot volume size**.

13. For the Boot volume size in GB, enter **250**.

Boot volume

Your [boot volume](#) is a detachable device that contains the image used to boot your compute instance.

Specify a custom boot volume size

[Volume performance](#) varies with volume size. Default boot volume size: -

Boot volume size (GB)

250

Integer between 50 GB and 32,768 GB (32 TB). Must be larger than the default boot volume size for the selected image.

Encrypt this volume with a key that you manage

By default, Oracle manages the keys that encrypt this volume, but you can choose a key from a vault that you have access to if you want greater control over the key's lifecycle and how it's used. [Learn more about managing your own encryption keys](#)

[Show advanced options](#)

Cloud-Init

You can use cloud-init, an open-source package used for initial configuration to specify some settings for your new vNIOS for OCI instance. In this guide, we will use cloud-init to set necessary temporary licences for the vNIOS instance.

1. Click on **Show Advanced Options**.
2. On the Management tab of Advanced Options, under Initialization Script you will see options for cloud-init.
3. Select **Paste cloud-init script**.
4. In the Cloud-init script text box, paste the following:

```
#infoblox-config
```

```
temp_license: nios CP-V2205 enterprise cloud_api dns
```

Note: This will apply temporary licenses for the Grid, NIOS model CP-V2205 virtual appliance, cloud platform, and DNS. For additional information on cloud-init configuration available for vNIOS instances, refer to NIOS documentation at <https://docs.infoblox.com>.

Hide Advanced Options

Management Networking Image Placement

Instance metadata service ⓘ

Require an authorization header
When enabled, applications that rely on the [instance metadata service \(IMDS\)](#) must use the IMDSv2 endpoint and provide an authorization header. All requests to IMDSv1 are denied. Enable this setting only if the image supports IMDSv2.

Initialization Script

You can provide a startup script that runs when your instance boots up or restarts. Startup scripts can install software and updates, and ensure that services are running within the virtual machine.

Choose cloud-init script file Paste cloud-init script

Cloud-init script

```
#infoblox-config
temp_license: nios CP-V2205 enterprise cloud_api dns

Add Secondary VNIC

Oracle Cloud does not provide an option to add additional VNICs while deploying an instance. The vNIOS instance requires two network interfaces to boot. To complete the deployment, we will attach a second VNIC to serve as the vNIOS LAN1 interface.

1. On the Instance Details page, scroll down and select **Attached VNICs** under resources.
2. Click **Create VNIC**.

13. Scroll to the top of the Instance Details page.
14. Click on **Reboot**.
15. In the Reboot Instance warning dialog, click **Reboot Instance**.

Reboot Instance [Help](#)

Rebooting the instance sends a shutdown command to the operating system. After waiting 15 minutes for the OS to shut down, the instance is powered off and then powered on.

If the applications on this instance take more than 15 minutes to shut down, they could be improperly stopped, resulting in data corruption. To avoid this, manually shut down the instance using the OS before you restart the instance in the Console.

Are you sure you want to reboot the instance **CP-01**?

Force reboot the instance by immediately powering off, then powering back on

[Reboot Instance](#) [Cancel](#)

16. Wait for the instance to reboot and show a status of Running.

Find VNIC IP Address

In order to join your vNIOS for OCI instance to an Infoblox Grid later, you will need to know the IP address of the LAN1 interface, which is the new VNIC just created. If you will connect to the Grid using VPN or FastConnect, you will only need the private IP. If you will be connecting via public IP, you will need to know that as well.

1. From the Instance Details page, click on **Attached VNICs** under Resources.
2. Click on the new VNIC you created.
3. The VNIC Details page shows private and public IP addresses for this interface.

Connect to vNIOS Instance

For the initial connection to your vNIOS instance, you will need to use a virtual console connection. From here you will be able to configure licensing and other basic settings as well as join the instance to your Infoblox Grid.

Create Console Connection

1. To create the Console Connection, scroll down on the Instance Details page.
2. Under Resources, select **Console Connection**.
3. Click on **Create Console Connection**.

Console Connection

Use a [console connection](#) to remotely troubleshoot a malfunctioning instance.

Create Console Connection

State	Fingerprint

4. On the Create Console Connection pane, select an SSH key option.
5. Either download the newly generated keys or select your public key file to use.
6. Click on **Create Console Connection**.

Create Console Connection

[Help](#)

Generate an SSH key pair or upload your own public key. After the console connection is active, you can connect to the serial console or VNC console using the associated private key.

- Generate SSH key pair Choose public key file Paste public key

Download the private key so that you can connect to the instance using SSH. It will not be shown again.

✓ Save Private Key ↓ [Save Public Key](#)

Create Console Connection

[Cancel](#)

7. Wait for the connection state to show Active.

Connect to Virtual Serial Console

1. Click on the 3 dots next to your Console Connection.
2. Select **Copy Serial Console** for your operating system.

Console Connection

Use a [console connection](#) to remotely troubleshoot a malfunctioning instance.

Create Console Connection		
State	Fingerprint	Compartment
Active	SHA256:HB107as0loqbEZFuHT0t06FoSIV+66/rqLhHVjAoc	Copy Serial Console Connection for Linux/Mac
		Copy Serial Console Connection for Windows

3. Paste the connection string into a text editor.

```
ssh -o ProxyCommand='ssh -W %h:%p -p 443 ocid1.instanceconsoleconnection.oc1.phx.anyhqljtg1535cqcea7t7xb5qsn4igbnml1weydym4mqwszsb5t5sxcg4hvda@instance-console.us-phoenix-1.oraclecloud.com' ocid1.instance.oc1.phx.anyhqljtg1535cq4c2yzzrq7jj2pjgbevxbfakszgjbyxh26yzzxuyx4lj42a
```

4. After the initial ssh, add **-i <your-private-key>**.
5. Inside the proxy command, after ssh, enter **-i <your-private-key>**.

```
ssh -i ssh-key-2021-01-12.key -o ProxyCommand='ssh -i ssh-key-2021-01-12.key -W %h:%p -p 443 ocid1.instanceconsoleconnection.oc1.phx.anyhqljtg1535cqcea7t7xb5qsn4igbnml1weydym4mqwszsb5t5sxcg4hvda@instance-console.us-phoenix-1.oraclecloud.com' ocid1.instance.oc1.phx.anyhqljtg1535cq4c2yzzrq7jj2pjgbevxbfakszgjbyxh26yzzxuyx4lj42a
```

6. Open a terminal and navigate to the directory where you stored your private key.
7. Copy and paste your edited connection string into the terminal.

```
oci-ssh % ssh -i ssh-key-2021-01-12.key -o ProxyCommand='ssh -i ssh-key-2021-01-12.key -W %h:%p -p 443 ocid1.instanceconsoleconnection.oc1.phx.anyhqljtg1535cqcea7t7xb5qsn4igbnml1weydym4mqwszsb5t5sxcg4hvda@instance-console.us-phoenix-1.oraclecloud.com' ocid1.instance.oc1.phx.anyhqljtg1535cq4c2yzzrq7jj2pjgbevxbfakszgjbyxh26yzzxuyx4lj42a
```

8. If prompted, enter **yes** to continue connecting.
9. If prompted, enter **yes** again to add the instance to your known hosts.

```

Join vNIOS Instance to Grid

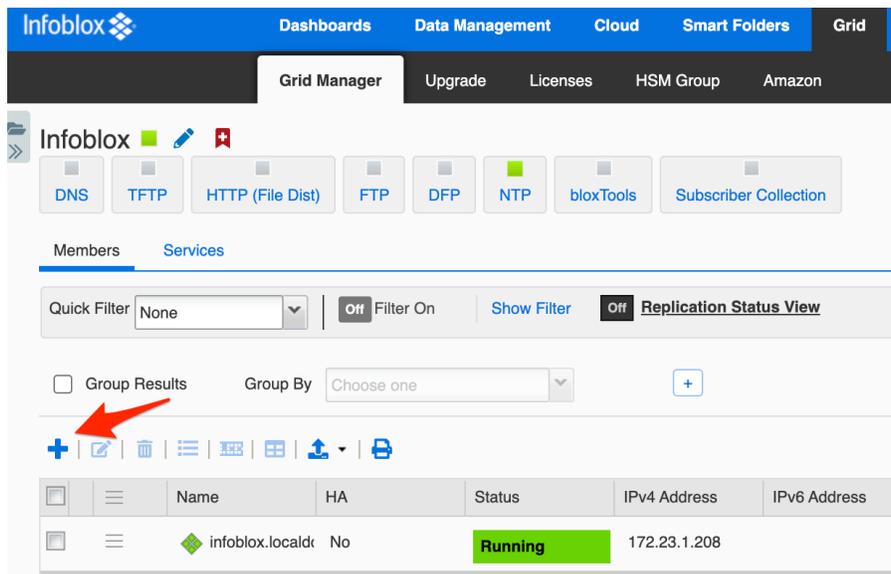

Cloud Platform members such as the CP-V2205 available on OCI cannot serve as Grid Masters and must be joined to an existing on-premises Grid. Grid communication can take place over VPN and OCI FastConnect or

if needed using public IP addresses via the public Internet. In this guide we will use Infoblox NIOS NAT settings to join a Grid using public IP addresses.

Provision vNIOS Member in Grid

Before joining the new member to your Infoblox Grid, you will need to add the member in your Grid Manger. This can be done through the Grid Manager GUI or APIs. This guide demonstrates how to add a Grid member using the GUI.

1. In the Grid Manager of your existing Grid, navigate to the **Grid** → **Grid Manager** → **Members** tab.
2. Click the  (Add) button.

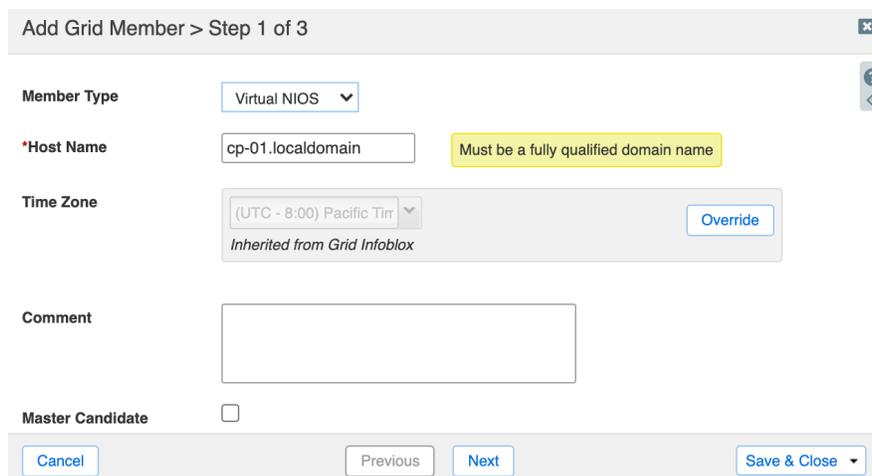

3. On step 1 of the Add Grid Member wizard, use the dropdown to select **Virtual NIOS** for Member Type.
4. Enter a Host Name.

Note: This must be a fully qualified domain name, for example cp-01.localdomain.

Warning: Do NOT select Master Candidate for this member as CP appliances cannot serve as GM or GMC.

5. Click **Next**.

The screenshot shows the 'Add Grid Member > Step 1 of 3' wizard form. The form has a title bar with a close button (X). The fields are: 'Member Type' with a dropdown menu set to 'Virtual NIOS'; '*Host Name' with a text input field containing 'cp-01.localdomain' and a yellow warning box that says 'Must be a fully qualified domain name'; 'Time Zone' with a dropdown menu set to '(UTC - 8:00) Pacific Tir' and an 'Override' button; 'Comment' with a text area; and 'Master Candidate' with a checkbox. At the bottom, there are buttons for 'Cancel', 'Previous', 'Next', and 'Save & Close'.

6. On step 2, use the dropdown to select **IPv4** for Type of Network Connectivity.
7. Select **Standalone Member** for Type of Member.
8. Enter the private IP address for the LAN1 interface.
9. Enter the Subnet Mask for LAN1.
10. Enter the default gateway for LAN1.

Note: The default gateway for a subnet in OCI will be the first available IP address in the subnet by default.

11. Click **Save & Close**.

Add Grid Member > Step 2 of 3 ✕

Configure NAT

If you will be using public IP addressing to join this member to the Grid, the following steps describe how to enable NAT for the member. You will also need to configure NAT and potentially NAT groups for the Grid Master if you have not set this up before. Refer to NIOS documentation at <https://docs.infoblox.com> for further information on configuring NAT and NAT Groups.

1. If you will be using public IP addressing to join this member to the Grid, select the member.
2. Open the action menu for the member and select **Edit**.

3. In the Grid Member Properties Editor, click **Toggle Advanced Mode**.
4. Click **Network**.

5. On the Network page, click on **Advanced**.
6. Scroll down and select the checkbox for **Enable NAT Compatibility**.
7. Enter the public IP address for LAN1 of your vNIOS for OCI instance.

Note: NAT Groups are not covered in this guide. For information on configuring NAT groups, refer to NIOS documentation at <https://docs.infoblox.com>.

8. Click **Save & Close**.

9. Click **Yes** in the Warning dialog.

Warning ✕

 **Warning: Changing the network settings of this grid member may affect services on other members. To avoid service discrepancies, restart services on the affected members or on all members.**

No Yes

Configure and Join Member to Grid

Once you have completed provisioning the new member in the Grid, you can use the CLI to join the member.

1. Log back into your vNIOS for OCI instance using the console connection as previously described.
2. Enter the command **set membership**.
3. Enter the private or public IP address of your Grid Master, depending on the type of networking used for Grid communication.
4. Enter the Grid name (default is **Infoblox**).
5. Enter the Grid shared secret (default is **test**).
6. Enter **Y** to confirm (you will be prompted twice).

```

Infoblox > set membership
Join status: No previous attempt to join a grid.
Enter New Grid Master VIP: 184.169.254.86
Enter Grid Name [Default Infoblox]: Infoblox
Enter Grid Shared Secret: test
Join grid as member with attributes:
Grid Master VIP:      184.169.254.86
Grid Name:            Infoblox
Grid Shared Secret:  test

WARNING: Joining a grid will replace all the data on this node!
Is this correct? (y or n): y

```

- The instance will restart and attempt to contact the Grid Master. You can watch progress in the console or in Grid Manager.
- Once the member successfully joins the Grid, It will show as Running in Grid Manager.

The screenshot shows the 'Members' tab in the Infoblox Grid Manager. At the top, there are controls for 'Quick Filter' (set to 'None'), 'Filter On' (Off), 'Show Filter', and 'Replication Status View' (Off). Below these are options for 'Group Results' (unchecked) and 'Group By' (set to 'Choose one'). A toolbar with various icons is visible above the table. The table itself has the following data:

	Name	HA	Status	IPv4 Address	IPv6 Address
	infoblox.locald	No	Running	172.23.1.208	
	cp-01.localdorr	No	Running	192.168.1.4	

- Once the member shows as Running, you can configure services as desired. Refer to <https://docs.infoblox.com> for information on configuring members and services. Additionally, you can refer to the [Deployment Guide: Infoblox Cloud Platform and Cloud Network Automation](#) for details specific to CP members.

Set vNIOS Instance as Primary DNS for Subnet

OCI allows you to specify custom DNS name servers for your VCN using DHCP options. These can be name servers on the Internet, in a VCN, or in your on-premises network via VPN or FastConnect. Prior to setting your vNIOS for OCI instance as a name server for your VCN, ensure you have configured the DNS service. Refer to <https://docs.infoblox.com> for details on configuring the DNS service.

- In the OCI console, use the services menu to navigate to **Networking** → **Virtual Cloud Networks**.
- Click on your VCN.

- On the VCN Details page, click on **DHCP Options** under Resources.
- Click on **Create DHCP Options**.

Limitations

The following are current limitations of using Infoblox NIOS with OCI:

- DHCP from Infoblox vNIOS instances can only be used to serve on-premises clients. The DHCP service will not work for OCI VCNs and VMs.
- vDiscovery of OCI resources is not available.
- Only the CP-V2205 model appliance is supported on OCI. CP appliances cannot act as GM or GMC, thus the virtual appliance must be connected to an existing Grid.
- HA and LAN2 interfaces are not supported for vNIOS appliances running on OCI.
